

The use of extensive cattle ranching as a tool for sustainable forest management in agroforestry mosaics

Collaboration in the implementation of a silvopastoral project in the Vall del Corb area through the use of intelligent collar systems that facilitate the creation of virtual fences and thus reduce the economic and landscape impact of the fences.

We value the role of extensive and semi-extensive livestock farming in landscape management and fire prevention

We ensure generational succession in the livestock sector and consolidate the economic viability of extensive and semi-extensive livestock farming projects

We promote transformational models, capable of reconciling maintenance of the agroforestry mosaic, fire prevention, biodiversity and the revitalisation of agricultural and livestock farming activities in an area

Climate risks addressed:

Increased risk of forest fires

Decrease in crop and pasture production

Start date: 29/11/2024

Lead partner: Associació Leader de Ponent
